

# Week 3 Lab

## Objectives

In this week's lab exercises, you will:

- Figure out how to sort 3 numbers using `if` s and `functions` ,
- Fix up the confusing code that was covered in the tutorial and report on what you had to fix,

### Don't forget:

- exercises marked as "pair" should be completed with your lab pair, and done as pair programming, which means that there should be two of you at one computer. Don't split up and do half of the work each, the idea is that you work together and talk about how you're solving the problem.
- Try alternating who types for each activity. Only one of each pair needs to submit these activities.
- Don't leave the lab without making sure you understand the assignment. Make sure to ask any questions you have whilst the tutor is still around.
- Make a plan in your blog about how you will approach and schedule the work for your assignment.
