

# List Find Largest

This is a **pair** exercise and must be completed in your **tutorial** or **lab** with your partner.

For this activity, you will be looking at a linked list.

Download [list.h](#), or copy it into your current directory on a CSE system by running

```
$ cp /web/cs1511/17s2/week11/files/list.h .
```

Make sure you understand the `list` and `node` data structures before beginning this task.

Create a file called `listFindLargest.c` that includes the `list.h` header file. In it, you should implement `listFindLargest`, a function which takes a linked list and returns the largest value in the list. It should have this prototype:

```
int listFindLargest (List l);
```

You should write your own tests in a separate file; `listFindLargest.c` should *not* contain a `main`.

To run some simple automated tests:

```
$ 1511 autotest listFindLargest
```

To run Styl-o-matic:

```
$ 1511 stylomatic listFindLargest.c
Looks good!
```

You'll get advice if you need to make changes to your code.

Submit your work with the `give` command, like so:

```
$ give cs1511 wk13_listFindLargest
```

Or, if you are working from home, upload the relevant file(s) to the `wk13_listFindLargest` activity on [Give Online](#).
